

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

In a similar manner may all the joint life formulæ be derived from the single, without the trouble of investigating each particular case independently of the single life formulæ.

Obs.—*Formulæ* (2), (3), (4), and (7), are, I believe, *new*, as I have never seen them in any work that has come under my notice; (2) and (4) will be found very serviceable in computing a table of reversion by means of a reciprocal probability table, such as Table XXIV. given in the first volume of Jones, page 550, and the ordinary life annuity tables.

W. C. O.

ON CERTAIN COMMUTATION FORMULÆ.

To the Editor of the Assurance Magazine.

SIR,—The communications of Messrs. Laundy and Sprague,* in the last Number of the *Assurance Magazine*, have induced me to send you a few “Commutation Table” formulæ which I have had occasion to make use of in practice, and which, as not lying quite on the surface of the subject, may prove a useful contribution to those interested in them.

The notation used is that employed by Professor De Morgan, where “ l_x ” represents the number living at age x , “ $p_{x:n}$ ” the probability of a life aged x living n years, “ v ” = $\frac{1}{1+r}$, the present value of £1 due a year hence, &c.

1. Endowment of £1 payable to (x) if alive n years hence; premium to be returned in the event of death; p per £1 Office commission added.

$$\text{Single premium, } \frac{(1+p) D_{x+n}}{D_x - (1+p) (M_x - M_{x+n})}.$$

$$\text{Annual premium, } \frac{(1+p) D_{x+n}}{(N_{x-1} - N_{x+n-1}) - (1+p) (R_x - R_{x+n} - n M_{x+n})}.$$

2. *Life assurance*.—Annual premium payable until death, on which the whole of the premiums paid (without interest) are to be returned. Commission of p per £ on net value.

$$\pi = \frac{(1+p) M_x}{N_{x-1} - (1+p) R_x}.$$

3. Assurance for n years on (x), with endowment payable should he survive that term, but the benefit payable only provided (y) be alive.

$$\text{Single premium, } \frac{D_{x+n, y+n}}{D_{x, y}} \cdot (1 - A_{x+n, y+n}^1) + A_{x, y}^1.$$

$$\text{Annual premium, } \{D_{x+n, y+n} (1 - A_{x+n, y+n}^1) + D_{x, y} A_{x, y}^1\} \div (N_{x-1, y-1} - N_{x+n-1, y+n-1}).$$

For the Carlisle 3 per cent. rates, the values $A_{x, y}^1$, &c., are got by inspection in Gray, Smith, and Orchard’s tables.

4. Endowment of £1 payable to (y) should he survive n years, and provided (x) die before.

* Mr. Sprague has overlooked the circumstance that his (joint life) formula previously appeared in Professor De Morgan’s able paper in the *Companion to the Almanac* for 1842.

To suit the published tables, the numerator must here change with the relation the ages bear to each other; thus:—

$$\begin{aligned} x < \text{or} = y. & \quad D_{x, y+n} - D_{x+n, y+n}. \\ x < (y+n) > y. & \quad v^{x-y} D_{x, y+n} - D_{x+n, y+n}. \\ x > \text{or} = y+n. & \quad v^n D_{x, y+n} - D_{x+n, y+n}. \end{aligned}$$

For *single premium*, the denominator must in each case be $D_{x,y}$, and for *annual premium*, $N_{x-1, y-1} - N_{x+n-1, y+n-1}$.

5. Assurance and endowment payable at the first death of (x) or (y), if within n years, or at the end of that term if they are both alive.

$$\text{Single premium, } 1 - \frac{(1-v)N_{x-1, y-1} - N_{x+n-1, y+n-1}}{D_{x,y}}.$$

$$\text{Annual premium, } \frac{D_{x,y}}{N_{x-1, y-1} - N_{x+n-1, y+n-1}} - (1-v).$$

6. *Educational endowments*.—Annual premium: k premiums in all for annuity of £1 per annum to (y), to be entered on at death of (x), if within n years, and thence to continue until annuitant attains age $y+n$.

$$x > y. \quad \frac{l_x v^{x-y} (N_y - N_{y+n}) - (N_{x,y} - N_{x+n, y+n})}{N_{x-1, y-1} - N_{x+k-1, y+k-1}}.$$

7. A current assurance for £ s on the joint lives of (x) and (y), on which an annual premium of P is payable, is to be converted into an assurance payable at the death of (x) only. The reduced premium is

$$\frac{P(1+a_{x,y}) - s(A_{x,y} - A_x)}{1+a_x},$$

and, in the “Commutation Table” formula, becomes

$$\frac{PN_{x-1, y-1} - s(vN_{x-1, y-1} - N_{x,y} - M_{x,y})}{l_y N_{x-1}};$$

$$\text{or, } \frac{N_{x-1, y-1} [P + s(1-v)] - s(D_{x,y} - l_y M_x)}{l_y N_{x-1}}.$$

To suit the published tables, if $x < y$, the factor “ l_y ” in the formula must, in each case, be changed to $l_y v^{y-x}$.

8. A current assurance for £ s on the life of (x), on which an annual premium of P is payable, is required to be converted into an assurance of the same amount payable at the first death of (x) or (y). Here the new benefit being of increased value, the Office commission of p per £1 on it has to be provided for, and the annual premium, payable during joint lives only, becomes

$$\frac{P(1+a_x) + s(1+p)(A_{x,y} - A_x)}{1+a_{x,y}};$$

or, by the “Commutation Table” formula,

$$\frac{l_y (PN_{x-1} - M_x) - s(1+p)N_{x,y}}{N_{x-1, y-1}} + s(1+p)v.$$

To suit the published tables, where $x < y$, the factor “ l_y ” must be altered to $l_y v^{y-x}$.

I am, Sir,

Your most obedient servant,

Aberdeen, 30th December, 1858.

H. A. S.
